METHODS OF CALCULATING FUNDAMENTAL SOLUTIONS OF THE
WAVE EQUATION, WITH TABLES

By William A. Mersman

SUMMARY

Methods of computing two specific, fundamental solutions of the wave equation are presented. These solutions are applicable to certain problems in the theory of wing-body interference in supersonic flow. One of the functions has been tabulated previously, and tables of the second function are presented here.

INTRODUCTION

A common method of solving boundary-value problems in many fields of applied mathematics is to compute and tabulate certain fundamental solutions of simple, idealized problems. Solutions of more complex problems, as well as approximate solutions of more practical problems, can then be obtained by superposition of these fundamental solutions.

Two such fundamental solutions of the wave equation in cylindrical coordinates have been discussed, one by Nielsen in reference 1 and one by Randall in reference 2. These authors are concerned with problems of wing-body interference in supersonic flow and supersonic flow over nearly circular cylinders, respectively. Both these authors give complete discussions of the history and applications of their solutions. Nielsen presents exhaustive tables, which were computed by the present writer (ref. 3). Randall gives brief tables of his solution. Both Nielsen's and Randall's solutions are two-dimensional generalizations of certain one-dimensional solutions given originally by Ward (ref. 4, pp. 172-175).

In view of the foregoing, the present paper is devoted entirely to the mathematical problem of computing these fundamental solutions. The various methods used in computing Nielsen's solution are presented first. Next it is shown that Randall's solution is obtainable directly from Nielsen's by quadrature, and tables of Randall's solution are presented. Finally, it is shown that both solutions can be obtained simultaneously by the method of characteristics, and this was done to provide an independent check on both sets of tables.

SYMBOLS

A,B,C,D,G	intermediate quantities used in method of characteristics
$a_{n,m}; b_{n,m}; \{ c_{n,m} \}$	coefficients in power series
F_n	derivatives of Legendre functions
$F(z,r), A, B$	subsidiary quantities in appendix C
f_n	Laplace transform of F_n
H_n	kernel of integral equation
h_n	Laplace transform of H_n
K,E	complete elliptic integrals
K_n	modified Bessel function of second kind
K_n'	derivative of K_n
k	modulus of elliptic integral
k'	complementary modulus of elliptic integral
$L\{ \}$	Laplace transform
n	order number
P	$\frac{\partial R_n}{\partial \xi}$
P_n	Legendre functions
p	independent variable in Laplace transformation
$p_{n,j}$	coefficients in power series for Legendre functions
Q	$\frac{\partial R_n}{\partial \eta}$
R_n	modified Randall's function
r	independent variable in radial direction
S	$\frac{\partial^2 R_n}{\partial \xi \partial \eta}$

U_n	solution of integral equation
u_n	Laplace transform of U_n
V_n	Randall's function
W_n	Nielsen's function
w_n	Laplace transform of W_n
x, z	independent variables in stream direction
$\beta, \psi^*, \rho, \alpha$	transformation variables in appendix B
Γ	gamma function
Δ	$\begin{cases} z, r & \text{spacing in method of finite differences} \\ \xi, \eta & \text{spacing in method of characteristics} \end{cases}$
(v, k)	Hankel's symbol
ξ, η	characteristic coordinates
Φ	$\frac{n\Delta}{r}$
Ψ	function representing either W_n or R_n in boundary-value problem
ψ	Laplace transform of Ψ

DEFINITION OF THE FUNCTIONS

Both Nielsen's and Randall's functions are defined by means of their Laplace transforms. With obvious, slight changes in notation the definitions are

$$\int_0^\infty W_n(x, r) e^{-px} dx = \frac{e^{pr} K_n(pr)}{e^{pr} K_n'(p)} + \frac{1}{\sqrt{r}} \quad (1)$$

$$\int_0^\infty R_n(x, r) e^{-px} dx = - \frac{e^{pr} K_n(pr)}{p e^{pr} K_n'(p)} \quad (2)$$

The function, $W_n(x,r)$, as defined here is precisely Nielsen's function. Randall defines a function, $V_n(x,r)$, whose Laplace transform does not contain the exponential factors of equation (2) above. Thus, by reference 5, the functions R_n and V_n are related as follows:

$$V_n(x,r) = \begin{cases} 0 & \text{if } x < r-1 \\ R_n(x-r+1,r) & \text{if } x \geq r-1 \end{cases} \quad (3)$$

The functions W_n and R_n are the ones to be discussed in the present paper.

METHODS OF COMPUTATION

Nielsen's function, $W_n(x,r)$, was computed first. Three different methods were used:

1. Power series, for $0 \leq x \leq 1.5$, all n ,
2. Integral equation, for $x > 1.5$, $n \leq 5$,
3. Finite differences, for $x > 1.5$, $n > 5$.

The function $R_n(x,r)$ was then computed from $W_n(x,r)$ by quadrature. Finally, both functions were computed simultaneously by the method of characteristics. Each of these methods will now be described in detail.

Power Series

Denoting the Laplace transform of $W_n(x,r)$ by $w_n(p,r)$, one can write equation (1)

$$w_n(p,r) = \frac{e^{pr} K_n(pr)}{e^{pK_n'(p)}} + \frac{1}{\sqrt{r}}$$

Replacing the Bessel functions by their asymptotic series (ref. 6) gives

$$w_n(p, r) = \frac{1}{\sqrt{r}} - \frac{1}{\sqrt{r}} \frac{\sum_{m=0}^{\infty} \frac{a_{n,m}}{p^m}}{\sum_{j=0}^{\infty} \frac{b_{n,j}}{p^j}} \quad (4)$$

where

$$a_{n,m} = \frac{(n,m)}{(2r)^m} \quad (5)$$

$$b_{n,j} = \frac{(n-1,j) + (n+1,j)}{2^{j+1}} \quad (6)$$

the Hankel's symbols, (ν, k) , being defined by

$$(\nu, k) = \frac{\Gamma\left(\nu + k + \frac{1}{2}\right)}{k! \Gamma\left(\nu - k + \frac{1}{2}\right)} \quad (7)$$

The Hankel's symbols are easily computed by means of the recurrence relations:

$$(\nu, 0) = 1$$

$$(\nu, k+1) = (\nu, k) \frac{\left(\nu + k + \frac{1}{2}\right) \left(\nu - k - \frac{1}{2}\right)}{k+1}, \quad k = 0, 1, 2, \dots$$

Thus, for example,

$$(v,1) = v^2 - \frac{1}{4}$$

$$(v,2) = \frac{\left(v^2 - \frac{1}{4}\right)\left(v^2 - \frac{9}{4}\right)}{2}$$

$$(v,3) = \frac{\left(v^2 - \frac{1}{4}\right)\left(v^2 - \frac{9}{4}\right)\left(v^2 - \frac{25}{4}\right)}{3!}$$

etc., and the first few a's and b's are

$$a_{n,0} = 1 , \quad b_{n,0} = 1$$

$$a_{n,1} = \frac{4n^2 - 1}{8r} , \quad b_{n,1} = \frac{4n^2 + 3}{8}$$

$$a_{n,2} = \frac{(4n^2 - 1)(4n^2 - 9)}{128r^2} , \quad b_{n,2} = \frac{16n^4 + 56n^2 - 15}{128}$$

etc.

Returning to equation (4), one can write $w_n(p,r)$ as a series

$$w_n(p,r) = \frac{1}{\sqrt{r}} \sum_{m=1}^{\infty} \frac{c_{n,m}}{p^m} \quad (8)$$

where the c's are given by the recurrence relations,

$$c_{n,0} = -1$$

$$c_{n,m} = -a_{n,m} - \sum_{k=0}^{m-1} b_{n,m-k} c_{n,k} , \quad m = 1, 2, 3, \dots$$

Thus, for example,

$$c_{n,1} = \frac{1 - 4n^2}{8r} + \frac{4n^2 + 3}{8}$$

$$c_{n,2} = -\frac{(4n^2-1)(4n^2-9)}{128r^2} + \frac{(4n^2-1)(4n^2+3)}{64r} - \frac{16n^4 - 8n^2 + 33}{128}$$

etc.

Finally, inverting the Laplace transform of equation (8) gives the desired power series

$$W_n(x,r) = \frac{1}{\sqrt{r}} \sum_{m=1}^{\infty} \frac{c_{n,m}}{m!} x^{m-1} \quad (9)$$

In particular, setting $x = 0$ gives the special value

$$W_n(0,r) = \frac{c_{n,1}}{\sqrt{r}} = \frac{1}{8\sqrt{r}} \left(4n^2 + 3 + \frac{1 - 4n^2}{r} \right) \quad (10)$$

and setting $r = 1$ in this gives

$$W_n(0,1) = \frac{1}{2} \quad (11)$$

This power series, truncated at $m = 50$, was used to compute $W_n(x,r)$ for $0 \leq x \leq 1.5$. The coefficients were computed by the recurrence relations, using fixed decimal arithmetic and retaining seven digits to the left of the decimal point and thirteen to the right. These calculations were performed on the Burroughs Datatron-204, a magnetic drum computer.

Integral Equation

For values of x greater than 1.5 the power series converges too slowly or not at all, and other methods must be used. It is convenient

to begin with the following formula (ref. 7):

$$L \left\{ P_n - \frac{1}{2} (x+1) \right\} = \sqrt{\frac{2}{\pi p}} e^{p K_n(p)} \quad (12)$$

Next introduce

$$F_n(x) = \frac{d P_n - \frac{1}{2} (x+1)}{dx} \quad (13)$$

and

$$H_n(x) = \frac{1}{2} [F_{n-1}(x) + F_{n+1}(x)] \quad (14)$$

The Laplace transforms of F_n and H_n are

$$f_n(p) = \sqrt{\frac{2p}{\pi}} e^{p K_n(p)} - 1$$

$$h_n(p) = -1 - \sqrt{\frac{2p}{\pi}} e^{p K_n'(p)}$$

Finally, introduce $U_n(x)$ and its transform, $u_n(p)$, defined by

$$u_n(p) = \frac{h_n(p)}{1 + h_n(p)} \quad (15)$$

Then the transform, $w_n(p,r)$, equation (1), can be transformed into

$$w_n(p,r) = \frac{1}{\sqrt{r}} [u_n(p) - f_n(pr) + u_n(p)f_n(pr)] \quad (16)$$

Taking the inverse Laplace transforms of equations (15) and (16) gives

$$U_n(x) + \int_0^x U_n(\xi) H_n(x-\xi) d\xi = H_n(x) \quad (17)$$

and

$$W_n(x,r) = \frac{1}{\sqrt{r}} \left[U_n(x) - \frac{1}{r} F_n \left(\frac{x}{r} \right) + \frac{1}{r} \int_0^x F_n \left(\frac{\xi}{r} \right) U_n(x-\xi) d\xi \right] \quad (18)$$

A-315•

Thus, equation (17) is an integral equation for the function $U_n(x)$. This equation does not contain r , so that this technique effects a partial separation of the variables x and r . The solution of the integral equation (17) and the evaluation of W by means of equation (18) were both performed by numerical quadrature, using fixed decimal arithmetic. These calculations were performed on an IBM type 701 electronic computer. Tables of the functions F_n and H_n were computed and prestored; then U_n was computed from (17) and W_n from (18). Details of these calculations will be found in appendix A.

This method was used for $1.5 < x, 0 \leq n \leq 5$. For larger values of n it was not possible to retain sufficient accuracy in the calculation of U_n .

Finite Differences

After exploitation of the two preceding methods, there still remained the problem of computing $W_n(x,r)$ for $x > 1.5, n > 5$. This was solved by expressing $W_n(x,r)$ as the solution of the following boundary value problem:

$$\frac{\partial^2 W_n}{\partial r^2} + \frac{1}{r} \frac{\partial W_n}{\partial r} - \frac{\partial^2 W_n}{\partial z^2} - \frac{n^2}{r^2} W_n = 0 \quad (19)$$

$$W_n = \frac{1}{8\sqrt{r}} \left(4n^2 + 3 + \frac{1-4n^2}{r} \right) \quad \text{at } x = 0 \quad (20)$$

$$\frac{\partial w_n}{\partial r} = 0 \quad \text{at } r = 1 \quad (21)$$

where $z = x + r - 1$ and the partial derivatives with respect to r are obtained by holding z constant (see appendix B).

The usual method of solving such a problem numerically consists of replacing each partial derivative by a finite-difference quotient and then solving the resulting system of algebraic equations. However, there are many ways of approximating a partial derivative by a finite-difference quotient. For example, if parabolic interpolation is used, the customary formulas are

$$\left. \begin{aligned} \frac{\partial F}{\partial x} &\approx \frac{F(x+\Delta x) - F(x-\Delta x)}{2\Delta x} \\ \frac{\partial^2 F}{\partial x^2} &\approx \frac{F(x+\Delta x) - 2F(x) + F(x-\Delta x)}{(\Delta x)^2} \end{aligned} \right\} \quad (22)$$

This method failed here to give sufficient accuracy with a reasonable interval size. If the interval size had been reduced, the resulting system of equations would have been too large for the available computing machine. Therefore, a different method of finite differences was devised, namely the following:

$$\begin{aligned} w_n(z+\Delta, r) &= -w_n(z-\Delta, r) + \varphi^2 \left(-\frac{5}{6} + \frac{7}{90} \varphi^2 \right) w_n(z, r) \\ &+ \left(1 - \frac{1}{12} \varphi^2 + \frac{1}{360} \varphi^4 \right) \left[\left(1 + \frac{\Delta}{2r} \right) w_n(z, r+\Delta) \right. \\ &\left. + \left(1 - \frac{\Delta}{2r} \right) w_n(z, r-\Delta) \right] \end{aligned} \quad (23)$$

with $\varphi = n\Delta/r$. (See appendix C.)

$$w_n(z, r-\Delta) = w_n(z, r+\Delta)$$

A-315

when $r = 1$ in equation (23). The process was started by using the power series to compute the required values of W_{11} along two starting rays, $x = 1$ and $x = 1 + \Delta$. Equation (23) then produces W_n along the ray $x = 1 + 2\Delta$, and the process is repeated as often as desired. As Nielsen has already remarked in reference 1, this process does tend to become unstable. This instability was detected by keeping a running check on the fourth differences in the z direction. Whenever these differences became excessive, the calculation was backed up in z and the calculated values were smoothed before continuing.

This portion of the calculations was performed by Mr. Stewart M. Crandall of the Ames Research Center, who not only did the programming but also devised the smoothing technique which was critical to the success of the procedure. Again, the Burroughs Datatron was used to perform the calculations.

$R_n(x,r)$ By Quadrature

The preceding sections contain a complete description of the methods used in computing the tables of $W_n(x,r)$, which were published in reference 1. Randall's paper, reference 2, appeared at about this time, and it was decided to extend his tables to include values of r different from unity. Examination of equations (1) and (2) yields the simple relation

$$R_n(x,r) = \frac{1}{\sqrt{r}} - \int_0^x W_n(\xi,r)d\xi$$

so that $R_n(x,r)$ is easily obtained by quadrature if tables of $W_n(x,r)$ are available. This was done three times, using polynomial quadrature formulas of degree 2, 5, and 10, respectively. All three methods gave excellent agreement, and the tables presented herein are those obtained by the first method (Simpson's rule). These calculations were performed on an IBM type 650 Magnetic Drum Computer.

Method of Characteristics

Just before the tables of $R_n(x,r)$ had been completed it was decided to install an IBM type 704 Electronic Data Processing Machine at the Ames Research Center. The large size and high speed of this computer suggested the possibility of recomputing both functions by an independent method as a final check. An appropriate method is the method of characteristics, a description of which follows.

First it can easily be shown that R_n also satisfies the partial differential equation

$$\frac{\partial^2 R_n}{\partial r^2} + \frac{1}{r} \frac{\partial R_n}{\partial r} - \frac{\partial^2 R_n}{\partial z^2} - \frac{n^2}{r^2} R_n = 0$$

and the boundary condition

$$\frac{\partial R_n}{\partial r} = 0 \quad \text{at } r = 1$$

where, as before, $z = x + r - 1$ and the partial derivatives with respect to r are obtained by holding z constant. The remaining boundary condition is (see appendix B)

$$R_n = \frac{1}{\sqrt{r}} \quad \text{at } x = 0$$

Now introduce the characteristic coordinates ξ, η ,

$$\xi = \frac{z - r + 1}{\sqrt{2}}, \quad \eta = \frac{z + r - 1}{\sqrt{2}}$$

and define P, Q, S by

$$P = \frac{\partial R_n}{\partial \xi}, \quad Q = \frac{\partial R_n}{\partial \eta}, \quad S = \frac{\partial P_n}{\partial \eta} = \frac{\partial Q}{\partial \xi} = \frac{\partial^2 R_n}{\partial \xi \partial \eta}$$

Then W_n is given by

$$W_n = - \frac{\partial R_n}{\partial z} = - \frac{P + Q}{\sqrt{2}}$$

and the boundary-value problem transforms into

$$S = \frac{Q - P}{2r \sqrt{2}} - \frac{n^2 R_n}{2r^2} \quad (24)$$

with the boundary conditions

$$R_n = \frac{1}{\sqrt{r}} \quad \text{at } x = 0 \quad (25)$$

$$P = Q \quad \text{at } r = 1 \quad (26)$$

Recalling the definition of P, Q, S suggests immediately the following finite-difference approximations:

$$P(\xi + \Delta, \eta + \Delta) = P(\xi + \Delta, \eta) + \Delta \frac{S(\xi + \Delta, \eta) + S(\xi + \Delta, \eta + \Delta)}{2} \quad (27)$$

$$Q(\xi + \Delta, \eta + \Delta) = Q(\xi, \eta + \Delta) + \Delta \frac{S(\xi, \eta + \Delta) + S(\xi + \Delta, \eta + \Delta)}{2} \quad (28)$$

$$\begin{aligned} R_n(\xi + \Delta, \eta + \Delta) &= \frac{1}{2} \left[R_n(\xi, \eta + \Delta) + \Delta \frac{P(\xi, \eta + \Delta) + P(\xi + \Delta, \eta + \Delta)}{2} \right. \\ &\quad \left. + R_n(\xi + \Delta, \eta) + \Delta \frac{Q(\xi + \Delta, \eta) + Q(\xi + \Delta, \eta + \Delta)}{2} \right] \end{aligned} \quad (29)$$

and, of course, equation (24) is valid at every point. These equations can be solved algebraically to give the computing scheme:

$$G \equiv Q(\xi, \eta + \Delta) - P(\xi + \Delta, \eta) + \Delta \frac{S(\xi, \eta + \Delta) - S(\xi + \Delta, \eta)}{2}$$

$$A \equiv P(\xi, \eta + \Delta) + P(\xi + \Delta, \eta) + Q(\xi, \eta + \Delta) + Q(\xi + \Delta, \eta)$$

$$B \equiv S(\xi, \eta + \Delta) + S(\xi + \Delta, \eta) + \frac{G}{r \sqrt{2}}$$

$$C \equiv 2 + \left(\frac{n\Delta}{2r} \right)^2$$

$$R_n(\xi+\Delta, \eta+\Delta) = \frac{1}{C} \left[R_n(\xi, \eta+\Delta) + R_n(\xi+\Delta, \eta) + \frac{\Delta}{2} \left(A + \frac{B\Delta}{2} \right) \right]$$

$$S(\xi+\Delta, \eta+\Delta) = - \frac{n^2 R_n(\xi+\Delta, \eta+\Delta)}{2r^2} + \frac{G}{2r\sqrt{2}}$$

$$Q(\xi+\Delta, \eta+\Delta) = Q(\xi, \eta+\Delta) + \Delta \frac{S(\xi, \eta+\Delta) + S(\xi+\Delta, \eta+\Delta)}{2}$$

$$P(\xi+\Delta, \eta+\Delta) = Q(\xi+\Delta, \eta+\Delta) - G$$

where, throughout, $r = r(\xi+\Delta, \eta+\Delta)$. These equations are used whenever $r > 1$. When $r = 1$, the boundary condition (26) must be used, and the computing scheme is obtained by using (26) instead of (27) and

$$R_n(\xi+\Delta, \eta+\Delta) = R_n(\xi, \eta+\Delta) + \Delta \frac{P(\xi, \eta+\Delta) + P(\xi+\Delta, \eta+\Delta)}{2} \quad (30)$$

instead of (29). The resulting scheme is

$$D \equiv P(\xi, \eta+\Delta) + Q(\xi, \eta+\Delta) + \frac{1}{2} \Delta S(\xi, \eta+\Delta)$$

$$R_n(\xi+\Delta, \eta+\Delta) = \frac{R_n(\xi, \eta+\Delta) + \frac{1}{2} \Delta D}{1 + \frac{1}{2} \left(\frac{n\Delta}{2} \right)^2}$$

$$S(\xi+\Delta, \eta+\Delta) = - \frac{1}{2} n^2 R_n(\xi+\Delta, \eta+\Delta)$$

$$P(\xi+\Delta, \eta+\Delta) = Q(\xi+\Delta, \eta+\Delta)$$

$$= Q(\xi, \eta+\Delta) + \Delta \frac{S(\xi, \eta+\Delta) + S(\xi+\Delta, \eta+\Delta)}{2}$$

The calculations were carried out successively along characteristic rays $x = \text{constant}$, using the second scheme to start at $r = 1$ and then the first scheme for successive points. Values of P, Q, S, R_n for the

first ray (taken at $x = 1$) were obtained from power series expansions similar to those described earlier for W_n . Finally, W_n was computed by means of the equation

$$W_n = - \frac{P + Q}{\sqrt{2}}$$

The calculations were started at $x = 1$ rather than at $x = 0$ in order to avoid the region in which the rates of change are greatest. At the same time, since power series had previously been used for $0 \leq x \leq 1.5$, the overlap gave a valuable check. No instabilities whatever occurred with this method. Furthermore, the results were in complete agreement with those of the other methods, so that all the tabulated values are believed to be in error by less than one unit in the last digit printed. As was implied earlier, these calculations were performed on an IBM Type 704 Electronic Data Processing Machine.

APPENDIX A

CALCULATION OF LEGENDRE FUNCTIONS

In the integral equation method certain Legendre functions occur. The purpose of this appendix is to give the details of their calculation. Specifically, the problem is to compute

$$F_n(x) = \frac{dP_n - \frac{1}{2}(x+1)}{dx}$$

for integral values of n and positive values of x . The number of cases can be reduced to two by using the recurrence relations (ref. 8, pp. 308-309):

$$z \frac{dP_k(z)}{dz} - \frac{dP_{k-1}(z)}{dz} = kP_k(z)$$

$$\frac{dP_{k+1}(z)}{dz} - \frac{dP_{k-1}(z)}{dz} = (2k+1)P_k(z)$$

Eliminating P_k , setting $z = x + 1$, and introducing F_n gives the desired recurrence relation

$$F_{n+1}(x) = \frac{1}{n - \frac{1}{2}} \left[2n(x+1)F_n(x) - \left(n + \frac{1}{2}\right) F_{n-1}(x) \right] \quad (31)$$

Thus, if $F_n(x)$ can be computed for $n = -1, 0$, the higher order functions present no difficulty. Furthermore, again from reference 8, page 312

$$P_{-3/2} = P_{1/2}$$

so that $F_{-1} = F_1$ and it is sufficient to be able to compute F_0 and F_1 . For $0 \leq x \leq 1$ the Maclaurin's series is convenient (ref. 8, p. 312):

$$F_n(x) = \sum_{j=0}^{\infty} p_{n,j} x^j \quad (32)$$

where

$$p_{n,j} = \frac{\Gamma\left(n+j+\frac{3}{2}\right)}{2^{j+1} j! (j+1)! \Gamma\left(n-j-\frac{1}{2}\right)}$$

A-315.

The $p_{n,j}$ is easily computed by recurrence:

$$p_{n,0} = \frac{4n^2 - 1}{8}$$

$$p_{n,j+1} = p_{n,j} \frac{\left(n+j+\frac{3}{2}\right)\left(n-j-\frac{3}{2}\right)}{2(j+1)(j+2)}, \quad j = 0, 1, 2, \dots$$

For $x > 1$, F_0 and F_1 can be expressed as elliptic integrals by starting with Laplace's integral for the Legendre function (ref. 8, p. 313)

$$P_{n-\frac{1}{2}}(x+1) = \frac{1}{\pi} \int_0^\pi (1 + x + \sqrt{x^2 + 2x} \cos \varphi)^{n-\frac{1}{2}} d\varphi \quad (33)$$

Define the complementary modulus, k' , by

$$k' = x + 1 - \sqrt{x^2 + 2x} = \frac{1}{x + 1 + \sqrt{x^2 + 2x}} \quad (34)$$

and the modulus, k , by

$$k^2 = 1 - k'^2 = \frac{2\sqrt{x^2 + 2x}}{1 + x + \sqrt{x^2 + 2x}}$$

Then (33) can be transformed into

$$P_{n-\frac{1}{2}}(x+1) = \frac{2}{\pi} (k')^{\frac{1}{2}-n} \int_0^{\frac{\pi}{2}} (1 - k^2 \sin^2 \theta)^{n-\frac{1}{2}} d\theta$$

so that

$$\left. \begin{aligned} P_{-1/2}(x+1) &= \frac{2\sqrt{k'}}{\pi} K(k) \\ P_{1/2}(x+1) &= \frac{2}{\pi\sqrt{k'}} E(k) \end{aligned} \right\} \quad (35)$$

Since now

$$x > 1, \quad k' < \frac{1}{2 + \sqrt{3}} < 0.27$$

and K and E are readily computed by means of the usual series in powers of k' (ref. 9).

Finally, by reference 8, page 309,

$$\left. \begin{aligned} F_0(x) &= \frac{P_{1/2}(x+1) - (x+1)P_{-1/2}(x+1)}{2x(x+2)} \\ F_1(x) &= \frac{(x+1)P_{1/2}(x+1) - P_{-1/2}(x+1)}{2x(x+2)} \end{aligned} \right\} \quad (36)$$

APPENDIX B

FORMULATION OF THE BOUNDARY-VALUE PROBLEM

In the sections on finite differences and the method of characteristics it was asserted that the functions $W_n(x, r)$ and $R_n(x, r)$ are solutions of the following boundary-value problem:

$$\frac{\partial^2 \Psi(z, r)}{\partial r^2} + \frac{1}{r} \frac{\partial \Psi(z, r)}{\partial r} - \frac{\partial^2 \Psi(z, r)}{\partial z^2} - \frac{n^2}{r^2} \Psi(z, r) = 0$$

$$\frac{\partial \Psi(z, r)}{\partial r} = 0 \quad \text{at } r = 1$$

$$\left. \begin{aligned} \Psi &= \Psi_0 = \frac{1}{8\sqrt{r}} \left(4n^2 + 3 + \frac{1-4n^2}{r} \right) \text{ for } \Psi = W_n \\ \Psi &= \Psi_0 = \frac{1}{\sqrt{r}} \quad \text{for } \Psi = R_n \end{aligned} \right\} \text{ at } x = 0 \quad (37)$$

The purpose of this appendix is to prove these assertions, by showing that $L\{\Psi\}$ is given by equation (1) or (2), respectively. Since $z = x + r - 1$, it is first necessary to transform from (z, r) to (x, r) , by means of the transformation equations

$$\frac{\partial \Psi}{\partial z} = \frac{\partial \Psi}{\partial x}, \quad \frac{\partial^2 \Psi}{\partial z^2} = \frac{\partial^2 \Psi}{\partial x^2}$$

$$\frac{\partial \Psi(z, r)}{\partial r} = \frac{\partial \Psi(x, r)}{\partial r} - \frac{\partial \Psi(x, r)}{\partial x}$$

$$\frac{\partial^2 \Psi(z, r)}{\partial r^2} = \frac{\partial^2 \Psi(x, r)}{\partial r^2} - 2 \frac{\partial^2 \Psi(x, r)}{\partial x \partial r} + \frac{\partial^2 \Psi(x, r)}{\partial x^2}$$

The resulting boundary-value problem is

$$\frac{\partial^2 \Psi(x, r)}{\partial r^2} - 2 \frac{\partial^2 \Psi(x, r)}{\partial x \partial r} + \frac{1}{r} \left[\frac{\partial \Psi(x, r)}{\partial r} - \frac{\partial \Psi(x, r)}{\partial x} \right] - \frac{n^2}{r^2} \Psi(x, r) = 0$$

$$\frac{\partial \Psi(x, r)}{\partial x} = \frac{\partial \Psi(x, r)}{\partial r} \quad \text{at } r = 1$$

and the other boundary condition is still given by equation (37).

Taking Laplace transforms with respect to x , with

$$\psi(p, r) = L\{\Psi(x, r)\}$$

gives the problem

$$\frac{d^2 \psi}{dr^2} + \left(\frac{1}{r} - 2p \right) \frac{d\psi}{dr} - \left(\frac{p}{r} + \frac{n^2}{r^2} \right) \psi = \frac{-\Psi_0}{r} - 2 \frac{d\Psi_0}{dr} \equiv \beta \quad (38)$$

with the boundary condition

$$\frac{d\psi}{dr} = p\psi - \Psi_0 \quad \text{at } r = 1 \quad (39)$$

Note that

$$\beta = 0 \quad \text{for } \Psi = R_n(x, r)$$

$$\beta = \frac{1 - 4n^2}{4r^{5/2}} \quad \text{for } \Psi = W_n(x, r)$$

Define ψ^* by

$$\psi^* = \psi - \frac{1}{\sqrt{r}} \quad \text{if } \Psi = W_n$$

$$\psi^* = \psi \quad \text{if } \Psi = R_n$$

Then equation (38) becomes

$$\frac{d^2\psi^*}{dr^2} + \left(\frac{1}{r} - 2p \right) \frac{d\psi^*}{dr} - \left(\frac{p}{r} + \frac{n^2}{r^2} \right) \psi^* = 0 \quad (40)$$

and (39) becomes

$$\frac{d\psi^*}{dr} = p(\psi^* + 1) \quad \text{if } \Psi = W_n, \quad r = 1 \quad (41)$$

$$\frac{d\psi^*}{dr} = p\psi^* - 1 \quad \text{if } \Psi = R_n, \quad r = 1 \quad (42)$$

Finally, the transformations

$$\rho = pr$$

$$\psi^* = e^{\rho}\alpha(\rho)$$

reduce the problem to

$$\frac{d^2\alpha}{d\rho^2} + \frac{1}{\rho} \frac{d\alpha}{d\rho} - \left(1 + \frac{n^2}{\rho^2} \right) \alpha = 0 \quad (43)$$

$$\left. \begin{aligned} \frac{d\alpha}{d\rho} &= e^{-p} & \text{if } \Psi = W_n, & \quad \rho = p \\ \frac{d\alpha}{d\rho} &= -\frac{e^{-p}}{p} & \text{if } \Psi = R_n, & \quad \rho = p \end{aligned} \right\} \quad (44)$$

But (43) is precisely the modified Bessel equation (ref. 6, p. 77) giving immediately

$$\alpha = \frac{K_n(\rho)}{e^{p K_n'(p)}} \quad \text{if } \Psi = W_n$$

and

$$\alpha = -\frac{K_n(\rho)}{p e^{p K_n'(p)}} \quad \text{if } \Psi = R_n$$

and these immediately yield equations (1) and (2).

APPENDIX C

FINITE-DIFFERENCE APPROXIMATION

The purpose of this appendix is to derive equation (23), the finite-difference approximation to equation (19), which is repeated here for convenience (dropping the subscript n):

$$\frac{\partial^2 W}{\partial r^2} + \frac{1}{r} \frac{\partial W}{\partial r} - \frac{\partial^2 W}{\partial z^2} - \frac{n^2}{r^2} W = 0 \quad (19)$$

This can be rearranged as follows

$$\frac{\partial^2 W}{\partial z^2} + \frac{n^2}{r^2} W = F(z, r) \equiv \frac{\partial^2 W}{\partial r^2} + \frac{1}{r} \frac{\partial W}{\partial r}$$

Considered as an ordinary equation in z , the general solution is

$$W = A \cos \frac{n(z-z_0)}{r} + B \sin \frac{n(z-z_0)}{r} + \frac{r}{n} \int_{z_0}^z F(\xi, r) \sin \frac{n(z-\xi)}{r} d\xi$$

where z_0 is an arbitrary value of z and A, B are constants of integration. Setting z equal successively to $z_0 - \Delta$, z_0 , $z_0 + \Delta$ and eliminating A and B gives (dropping subscript 0), with $\varphi = n\Delta/r$:

$$\begin{aligned} W(z+\Delta, r) &= 2W(z, r)\cos \varphi - W(z-\Delta, r) + \frac{r}{n} \int_z^{z+\Delta} F(\xi, r) \sin \frac{n(z+\Delta-\xi)}{r} d\xi \\ &\quad + \frac{r}{n} \int_z^{z-\Delta} F(\xi, r) \sin \frac{n(z-\Delta-\xi)}{r} d\xi \end{aligned}$$

Now make the approximating assumption that $F(\xi, r) = F(z, r)$. In the first integral, set $y = z + \Delta - \xi$; in the second integral, set $y = z - \Delta - \xi$. Performing the integrations gives

$$W(z+\Delta, r) = 2W(z, r)\cos \varphi - W(z-\Delta, r) + 2 \left(\frac{r}{n}\right)^2 F(z, r)(1 - \cos \varphi)$$

but

$$F(z, r) = \frac{\partial^2 W(z, r)}{\partial r^2} + \frac{1}{r} \frac{\partial W(z, r)}{\partial r}$$

Using parabolic approximation in the r direction, analogous to equation (22), and expanding $\cos \varphi$ in a Maclaurin's series gives (23) immediately.
